Authorization for this examiner's amendment was given in a telephone interview with Paul Teng on 06/22/2009.

Claims 2, 3, 5, 8, 11, 15 & 21 are amended as follows:

2. An X-ray CT apparatus for generating a tomographic image by reconstructing projection data acquired by scanning a predetermined slice of a subject, said X-ray CT apparatus comprising

detecting means ~~for detecting~~ configured to detect a static cardiac time phase with a small amount of motion artifacts in a predetermined portion in a heart, vicinity thereof or tissues moving along therewith, of the subject based on heartbeat information acquired in association with the projection data, and

image reconstructing means ~~for generating~~ configured to generate the tomographic image by reconstructing projection data corresponding to the static cardiac time phase detected by the detecting means,

wherein the detecting means determines the static cardiac time phase of the predetermined portion based on correlation data between the heartbeat information and the static cardiac time phase of each of a plurality of different portions of the subject, that are previously determined.

3. An X-ray CT apparatus according to claim 2, ~~wherein the detecting means comprises~~ further comprising an input means for setting device configured to set the predetermined portion.

5. An X-ray CT apparatus according to claim 2, further comprising
memory means ~~for storing~~ configured to store the projection data acquired over a plurality of heart beat cycles and

a projection data synthesizing means ~~for reading~~ configured to read the projection data corresponding to the static cardiac time phase detected by the detecting means and synthesizing the projection data,

wherein the image reconstructing means reconstructs the projection data synthesized by the projection data synthesizing means.

8. An X-ray CT apparatus for generating a tomographic image by reconstructing projection data acquired by scanning a predetermined slice of a subject, said X-ray CT apparatus comprising

detecting means ~~for detecting~~ configured to detect a static cardiac time phase with a small amount of motion artifacts in a predetermined portion in a heart, vicinity thereof or tissues moving along therewith, of the subject based on heartbeat information acquired in association with the projection data, and

image reconstructing means ~~for generating~~ configured to generate the tomographic image by reconstructing projection data corresponding to the static cardiac time phase detected by the detecting means,

~~wherein the detecting means comprises~~

sample tomographic image rearranging means ~~for generating~~ configured to generate a plurality of sample tomographic images of respective different cardiac time phases based on the projection data and the heartbeat information, and

selecting means ~~for selecting~~ configured to select a sample tomographic image with a small amount of motion artifacts from the plurality of sample tomographic images,

wherein the detecting means determines the static cardiac time phase of the predetermined portion based on correlation data between the heartbeat information and the static cardiac time phase of each of a plurality of different portions of the subject, that are previously determined.

wherein the image reconstructing means generates the tomographic image by reconstructing projection data corresponding to the cardiac time phase of the sample tomographic image selected by the selecting means, and

wherein the selecting means calculates an integrated value of a CT value of each of the plurality of sample tomographic images in a predetermined region and selects a sample tomographic image with a smallest fluctuation of the integrated value of the CT value.

11. An X-ray CT apparatus according to claim 8, further comprising

memory means ~~for storing~~ configured to store the projection data acquired over a plurality of heart beat cycles and

projection data synthesizing means ~~for reading~~ configured to read the projection data corresponding to the cardiac time phase of the sample tomographic image selected by the selecting means and synthesizing the projection data,

wherein the image reconstructing means reconstructs the projection data synthesized by the projection data synthesizing means.

15. An X-ray CT imaging method of generating a tomographic image by reconstructing projection data acquired by scanning a predetermined slice of a subject, said X-ray CT imaging method comprising

(a) detecting a static cardiac time phase with a small amount of motion artifacts in a predetermined portion in a heart, vicinity thereof or tissues moving along therewith, of the subject based on heartbeat information acquired in association with the projection data, and

(b) generating the tomographic image by reconstructing projection data corresponding to the detected static cardiac time phase,

wherein said detecting the static cardiac time phase in (a) includes determining the static cardiac time phase of the predetermined portion based on correlation data between the heartbeat information and the static cardiac time phase of each of a plurality of different portions of the subject, that are previously determined.

21. An X-ray CT apparatus according to claim 2, further comprising:
memory means ~~for storing~~ configured to store said correlation data,

wherein the detecting means determines the static cardiac time phase of the predetermined portion based on the correlation data stored in said memory means.
